COMP3016 CW1 – Slippery Penguin (10909750)

Mechanics

During the main game loop, the player will be tasked with reaching the other side of the room by sliding across the ice. However the path is blocked by obstacles, in which must be used to figure out how to reach the objective. The obstacles are placed with an intended path in mind, in order to make the player carefully think about how to approach the puzzle.

Dynamics

Whilst the main game loop is active, the collision checks will take place, so that the player stops moving when hitting either an obstacle or the walls perpendicularly. The key element of this game is trial and error, by using the obstacles the player will be able to find new paths and test different ideas they may have had when figuring out solutions.

Aesthetics

Players are encouraged to explore different solutions and then upon finding the right path, will feel accomplished due to overcoming the difficulty of the puzzle. I want the movement to seem smooth, so that the player is able to focus on the trial-and-error aspect of the game. The game is intended to seem simple and fun, but still give players the satisfaction of overcoming a challenge.
